## Light Vehicle Motor Mounts

Motor Mounts compensate high vibrations that can result in certain driving modes by dampening the vibrations. Besides this, these Mounts supporting drive torques and isolating noise during start-up. This helps prevent booming noises and load change shocks, while a hydraulic damping system can reduce body and driveline vibrations.

## Hydro Mounts

- Vibracoustic Hydro Mounts for engine support enable to damp the excitation for various engines and load cases. This allows to choose the best characteristic for each mode.
- For a more comfortable or more dynamic drive, the individual portfolio of our Vibracoustic Hydro Mount can be set smart and individual for a big amount of several engine and gearbox mount combinations.
- The Vibracoustic patented concept saves resources and reduces weight, leading to lower fuel consumption. At the same time, it leads to higher reliability and safety.
- The original quality and robustness of Vibracoustic Hydro Mounts ensure a longer vehicle service life, less downtime and lower operating costs due to reduced replacement intervals.

Dampened vibrations prevent booming noises and load change shocks

Flexible fitting processes enable mounting of multiple Engine-Gearbox combinations in series

Recycled materials and regional serial production contributes to a high sustainability

Simplified and OEM approved design

Hydraulic unit is precise applied to various customer cars

Robustness of original quality components ensure cost saving
